

Snow Drift Brief

V1 Brainstorm

Snow Drift is an initial idea for a mobile-first social and cozy exploration game that can be played by yourself but is better if played with friends. It is intended to be a submission to the Friendzone Gamejam hosted by Regenesys labs.

The initial idea for the game is to use the paint mechanic we've developed for "digging" through extruded blocks (C:\Users\luke\AppData\Roaming\creator-hub\Scenes\dcl-canvas on the digger branch) as the base of the game. Each block will represent a chunk of snow.

The rough goal of the game will be to stay warm and alive as long as possible by keeping a campfire alive for as long as possible. At load in, players will spawn around an active campfire which is situated in the scene full of the "unpainted" blocks of snow. The campfire when active will melt the snow around it up to a certain radius. In the beginning of the game, there is a stack of wood by the campfire that the player can pick up and use to feed the fire. When the fire is fed, the flames become larger for a time and the melt radius of the campfire expands slightly. This melt/safe radius is the safezone or the friendzone to stay on theme with the gamejam theme.

Once the wood pile has been exhausted, players must venture out into the deep snow to find more wood to keep the fire alive. If players leave the warmth of the fire, a freeze bar appears that slowly drains from the cold. If they venture into deep snow, the freeze bar drops quicker. If they light a torch from the campfire and walk in to the snow, the snow melts around them similar to the prototype established in the canvas scene listed above.

Players must explore the snow, find wood, and bring it back to the fire to keep it alive as long as possible. Snow banks slowly will fill up again with snowfall covering tracks. As more land is uncovered, players must venture further and further away from the fire to find fuel. Maybe they find items along the way like jackets that slow the freeze meter dropping, hot cocoa which recharges their warmth. Or other campfires they can light to expand territory.

This project is intended to be built and shipped in 2-3 weeks and to be built primarily for mobile. Ideally, what we ship as a v1 is just the first step and the beginning of an expansion with regenesys labs for more work/money.
